✦ **STRAIGHTER HOLES** = Less wear on your pumps and lineshaft bearings, plus it provides a more uniform, evenly spaced gravel pack around your casing to minimize the intrusion of harmful sands. Our downhole tooling and stabilization at Premier Drilling, ranging from six (6) inches to twenty-eight (28) inches, are second to none for keeping your well straighter and on target.

✦ **MAXIMUM EFFICIENCY** = Managing your electrical power consumption is only possible by building the most efficient well we can construct. At Premier Drilling, we collect and analyze the entire ground formation profile (seen below) and work with you to categorize them for the best possible production while still filtering out the finer sands and clays that are destructive to your pump and well screens.

Less water drawdown in your well means less horsepower to lift water, providing lower power bills to you!

✦ **QUALITY** = At Premier Drilling our “A-Team” crews and supervisors only use quality materials. Upon completion, we airlift develop every well with a reverse circulation swabbing tool to maximize the potential of each individual screened zone.
